Summary

I have a keen interest and good understanding of various software technologies used in Apple hardware platforms such as **iOS**, running on iPhone/iPad and **macOS** running on Macs, along with **watchOS** and **tvOS**. I have experience with entire cycle of developing native apps for iOS. I am a registered Apple Developer and can assist in developing and deploying various solutions on Apple platform.

I am a big fan of beautifully designed software which is well crafted, end-to-end, keeping the target users in mind. Along those lines, I have a good understanding of Apple's user interface design paradigms (HIG's) and what makes a great app.

I believe crafting a good software which fulfils the aforementioned goals requires careful planning, execution and concerted symphony within the team. Keeping the said in mind, I continuously strive to hone my craft by exploring and learning best possible tools and technology for the job at hand. I am also inclined towards growing as a software engineer by constantly enhancing my understanding of fundamental concepts and tooling.

I have around **8 years** of experience working in Software industry taking up roles like Software Engineer, Technical Lead, Project Manager. I have also worked as an independent consultant. I like mentoring and training others and help a team grow and deliver quality output.

I am looking for roles which can leverage my skills and provide me with opportunities to work on challenging projects.
