

A: About the PCT project

1. About the project

The Propensity to Cycle Tool (PCT) project has been funded by the English Department for Transport (DfT). It has been developed by an academic-led team involving the universities of Cambridge, Leeds and Westminster. The PCT helps to provide an evidence base for planning for cycling. You can use it to explore cycling potential at different geographical scales – from a county to a potential route corridor. The PCT is an online tool that can be used for free by anyone with an internet connection. More advanced uses, such as the preparation of business cases, may involve the downloading of data from the PCT, in geographical and non-geographical form. The PCT is also open source and, in line with the Creative Commons licencing, users are welcome (and encouraged!) to build on the code and create their own projects.

2. About the manual

This manual (v. 1.0) represents the first version of the training material produced as part of the PCT project. Small updates may be made to this version, while a second version (v.2.0) will be completed by March 2017. Many of the sections also have corresponding short videos available; these allow the user to view the tool (or other software) in operation.

The manual is intended to introduce users to the tool and provide practical guidance on its use. For more technical detail we suggest reading our papers and DfT reports, or looking at the project code. Links to these are provided below.

3. Future Developments

The PCT manuals correspond to Phase 2 of this DfT-funded project, which ends in March 2017. Version 1.0 of the manual covers the tool as it exists in September 2016; while Version 2.0 of the manual will incorporate developments including Lower Level Super Output Area (LSOA) functionality, complementing the existing MSOA-level functionality.
